Session Log

Time: 32 minutes

ADD A "CREATE VALIDATION FIELD" FLOW TO MANAGEWORKFLOW

Development Run · Orchestrated Skill Chain · 2026-06-10

Session Log — Add “Create Validation Field” to `manageWorkflow`

A full record of the **development run** session: every question asked (via the interactive tool), the user’s response, and the files / fields read between each question. Ordered chronologically.

- **Date:** 2026-06-10
- **Skill chain:** agile-development-orchestrator → add-interactive-with-data-persistence-functionality-in-pather → shared FAQ → apex-method-resolution
- **Outcome:** new `ValidateField__c` create flow (LWC modal + controller + service + tests)

Phase 0 — Orchestrator routing

Reads before Q1

- `force-app/skills/development/` (glob of all skill .md files)
- `agile-development-orchestrator-skill.md` — trigger is `development run`; defines Steps 1–6 and the `AskUserQuestion-only` interaction constraint.

Q1 — Bug or task?

Q: Is this a bug or a task?

A: Task

Q2 — Which task option?

Q: Which task option? (A) new component / (B) new functionality / (C) add existing component

A: B — New functionality

Q3 — Parent or child?

Q: Is this new functionality on a parent (pather) component or a child component?

A: Parent (pather)

Reads after Q3 (delegating to the task-skill)

- `add-interactive-with-data-persistence-functionality-in-pather.md` — entry gate + Steps 0–6.

- **Step 0 mandatory-guide** activation: frontmatter (all six, read in parallel):

Guide	Mode	Applies when
lwc-path-architecture-guide.md	required	always
lwc-apex-call-implementation-guide.md	required	component calls Apex
lwc-error-handling-guide.md	required	always (via ShowToastEvent)
pather_lwc_state_management_checklist-guide.md	required	before emitting pather state code
apex-path-architecture-guide.md	required	only if a new Apex method/class is created
apex-input-architecture-guide.md	required	only if a new Apex method takes params

pather-add-functionality-faq.md — the question iteration (questions .1–.8).

Phase 1 — Interview FAQ (prefix = Step 2)

Q2.1 — Parent LWC

Q: Which parent LWC (name or path) is this new functionality for?

A: `manageWorkflow`

Reads after Q2.1 (Step 1 entry-gate verification)

- `manageWorkflow.js` — grep for `@salesforce/apex/ /@wire`.

Finding: imports from `ManageWorkflowPageController` (`getWorkflow`, `createStatus`, `addWorkflowTransition`, ..., `addValidationRule`). Entry gate **passed** (existing parent already uses Apex).

Q2.2 — Sub-components

Q: Which sub-component(s) does this new functionality apply to?

A: **Transition detail panel**

Q2.3 — User stories

Q: What are the user stories? Each operation (Load / Update / Create / Delete) needs its own story.

A: “As a user I want to create a new validation field” (one **Create** operation)

(First attempt errored — AskUserQuestion requires ≥ 2 options; re-asked with two options.)

Q2.4 — Behavior prompt

Q: Give me the functionality behavior prompt. It must cover every user story.

A: (see prompt below)

```
we should have a add validation rule button in the Transition detail
when the button is clicked a modal was show that show :
- combo box to choose the field api name
- combo box to choose the type of the validation
create button
cancel button
```

Coverage check (semantic): the single story *create a new validation field* is covered by the modal’s Create path. ✓

Reads after Q2.4 (validation sub-step)

- ask-user-for-lwc-validation.md — gate question + “required fields come from the object’s *for lwc* table in OBJECT_VALIDATION_LWC_APEX.md”.

Q2.5a — Validation needed?

Q: Does this component need any validation before it dispatches an event / calls Apex?

A: Yes

Q2.5b — Which validations?

Q: Which validations must run before the Create call?

A: Required fields only (both combo boxes mandatory; messages from the object’s *for lwc* table)

Q2.6 — Data state

Q: Which state provides the data? Name the source object and field.

A: “ai do that” (delegated determination to the assistant)

Reads after Q2.6 (determining the data state)

- Grep addValidationRule across force-app/main/default → found in manageWorkflow.js, ManageWorkflowPageControllerTest.cls, lwc/README.md.

- Glob objects/*alidation*/** → **no files** (no ValidationRule__c metadata in source).
- Glob objects/*/fields/* → discovered ValidateField__c with fields FieldName__c, Type__c, ErrorMessage__c, RecordStatus__c.
- Grep addValidationRule|ValidateField__c in ManageWorkflowPageController.cls → **no match** (controller no longer defines addValidationRule).
- Grep ValidationRule__c in classes/ → present in WorkflowConfigDTO, the test, and WorkflowService (getValidationRuleById, getPendingRules, insertValidationRule).
- Read controller (top 60) + glob ValidationRule__c/fields/* (none) + read test testAddValidationRule (356–376) → old signature wrote ValidationRule__c.TicketField__c.
- Grep @AuraEnabled in the controller → full method list (no addValidateField / addValidationRule).
- Grep ValidateField__c in classes/ → **no files** (no Apex backs the new object).

Field metadata read:

Field	Definition
Type__c	required Picklist, value Isn't Empty (default)
FieldName__c	required, restricted Picklist of Ticket field API names (AssignedTo__c, CurrentState__c, ..., Ticket_Type__c)
ErrorMessage__c	required Text(255)
RecordStatus__c	soft-delete status

Determined data state: ValidateField__c → FieldName__c (field combo) + Type__c (type combo); ErrorMessage__c derived server-side; RecordStatus__c soft-delete.

Q2.7 — Reusable base component

Q: Should the modal use existing base components?

A: c-ao-combobox + c-ao-btn

Reads after Q2.7 (Apex method resolution sub-step)

- apex-method-resolution.md — Branches A/B/C + Creation Sub-Loop (.1 what it does → recurse, .2 where, .3 cacheable).

Q2.8.1 — Which Apex method?

Q: Which Apex method should persist the new ValidateField__c?

A: C — Create it

Q2.8.1 (Creation Sub-Loop) — What should the controller do?

Q: What should the new controller method do?

A: Insert via a Service (controller validates inputs, delegates to `ValidateFieldService.createValidateField`)

Q2.8.1 depth-2 — Service method (recursed)

Q: `ValidateFieldService.createValidateField` doesn't exist. What should it do?

A: Build + insert `ValidateField__c` (set `RecordStatus` active, derive `ErrorMessage__c`, one DML, return the record)

(No further unresolved symbols → recursion ends.)

Q2.8.2 — Where should the methods live?

Q: Where should the two new methods live?

A: Controller existing + new Service (`addValidateField` in `ManageWorkflowPageController.cls`; `createValidateField` in a new `ValidateFieldService.cls` under `classes/domain/`)

Q2.8.3 — Cacheable?

Q: Should `addValidateField` be cacheable? (It performs an insert.)

A: Not cacheable → imperative LWC call; `@wire` branches skipped.

Phase 2 — Implementation context gathering (after FAQ)

Reads after Q2.8.3

- `manageWorkflow.js` (full) — found `handleCloseTransitionDetail()` already calls `undefined closeValidationRuleModal()`; `validators validateValidationType / validateTicketField` already imported; principal state is `workflowData`; `_toast` helper exists.
- Grep validation refs + read `workflowValidator.js` — sidecar already exports the two required-field rules.

- `manageWorkflow.html` (full) — modal patterns (`modal-backdrop / modal-container / ... / close-button`) and the Transition Detail header actions.
- `aoCombobox.js` — API: `label, placeholder, value, options ({label,value})`, emits `change → event.detail.value`.
- `OBJECT_VALIDATION_LWC_APEX.md` — **revealed the inconsistency**: documents `ValidationRule__c` but has no `ValidateField__c` entry.

Disambiguation surfaced here — the repo is mid-migration; the two validation objects disagree (see Phase 3).

Reads after the disambiguation (Apex patterns)

- `ManageWorkflowPageController.cls` (190–320) — `createStatus / createTransition / addWorkflowTransition` delegation style + end-of-class.
- `WorkflowService.cls` (1–160) — service shape, `insertValidationRule`, `ServiceException`, `WorkflowConstants` usage.
- `StatusService.cls` — per-object service template (`createStatus → build + insert + ServiceException`).
- Glob + read `WorkflowConstants.cls` (`RECORD_STATUS_ACTIVE = 'active'`), `APIResponse.cls` (2- & 3-arg constructors), `DomainCorrectness.cls` (`requireXExists` precondition).
- `StatusService.cls-meta.xml` — `apiVersion 62.0` (reused for the new class meta); controller end (319–340) is the insertion point.

Phase 3 — Object disambiguation (blocking decision)

Q: Which object should the new “validation field/rule” persist to? (repo mid-migration; the two objects disagree)

A: **`ValidateField__c`** (rules are global, not per-transition; `ErrorMessage__c` derived server-side)

Evidence presented:

	<code>ValidationRule__c</code> (old)	<code>ValidateField__c</code> (chosen)
In validation doc	✓	✗
Service / DTO / test support	✓	✗ (none)

	ValidationRule__c (old)	ValidateField__c (chosen)
Transition lookup	✅ WorkflowTransition__c	❌ (global)
Controller method	removed in “delete validation rule”	none yet (to be created)

Phase 4 — Code emitted

Concern	File
Service (build + insert)	classes/domain/ValidateFieldService.cls (new) + .cls-meta.xml
@AuraEnabled addValidateField	ManageWorkflowPageController.cls
Tests	removed dead ValidationRule__c tests; added testAddValidateField + missing-field test
Import swap + state + getters + handlers	lwc/manageWorkflow/manageWorkflow.js
Button + modal (two combos, btn)	lwc/manageWorkflow/manageWorkflow.html
Validator (reused)	lwc/manageWorkflow/workflowValidator.js

Checklists walked: task-skill Step 5 (7 rows) + pather_lwc_state_management_checklist (Rules 0–7). Bulkification skipped (single-record insert). soql-exclude-deleted N/A (no SELECT in the create path).

Phase 5 — End-of-skill decisions (Step 6)

Reads after Step 6 answers

- lwc-css-design-guide.md — Atlassian/Jira palette, \$9.5 modal recipe, \$8 input recipe.
- Grep manageWorkflow.css modal rules — existing rules already space stacked combos → **no new CSS needed**.
- ManageWorkflowPageControllerTest.cls (full) — to remove the dead validation-rule tests.

Q (multi) — Styling / Profiling / Broken test

Q (a): Apply lwc-css-design-guide to the new button + modal now? → **Yes** (satisfied by reuse — no new CSS)

Q (b): Run apex-method-monitor on addValidateField? → **No, skip profiling**

Q (c): The old validation-rule test blocks Apex deployment — how to handle? → **Remove the dead tests** (and add an addValidateField test)

Phase 6 — Loop back

Q: Start another development iteration, or are you done?

A: Done → orchestrator exited.
